

DISC TRAY ERROR SYSTEM

ABSTRACT OF THE DISCLOSURE

5

A processor, such as a laminator for laminating a film onto a disc, such as a CD, DVD or the like has a tray for holding a disc for movement from a loading position to a processing position. The
10 tray has a recess for receiving the disc, when the disc is properly positioned for processing. A sensor is provided to sense when a disc is not properly located in the recess, or when more than one disc, a warped disc or some other anomaly is present that may
15 damage the processor. As shown, the processor is a laminator for laminating a film onto an upper surface of a disc.
